

## IBM Preventative Maintenance and Quality

### Our Services

IBM's Preventative Maintenance and Quality Services (PMQ) by **ClearObject** leverage the existing analytics tools within your system to improve the level of quality and optimally maintain the assets across your entire production process.

PMQ allows your organization to analyze specific points or actions in your production process that could become more efficient, effective, or are in need of repair. This is accomplished by applying analytics tools to your existing systems, that access multiple data points in real time to predict asset failure, quality issues, or process risks. Understanding how your system works, and when it doesn't, is the first step to leveraging the power of IoT analytics to change the way you are able to detect failure patterns in your assets, products and business operations.

Predictive maintenance solutions from IBM, in combination with the services of **ClearObject** provide the following key benefits:

- Predict where, when and why asset failures are likely to occur
- Quickly identify primary variables as a part of root-cause analysis processes
- Identify potential concerns early on to allow you to deploy limited resources more cost effectively, maximizing equipment uptime
- Enhances the quality and supply chain process, ultimately resulting in improved customer satisfaction

### Key Benefits

Low upfront investment	Enterprise Security
Faster deployment	Rapid ROI
Application Managed Services	Lower TCO
Single Tenant
